

Niv Shtibel

Senior Security Backend Developer

+972-50-737-3456 | nivsvb@gmail.com | github.com/nivsv | linkedin.com/in/niv-shtibel | niv-shtibel.dev

TECHNICAL SKILLS

Languages: Node.js (Expert), TypeScript, Vanilla Javascript, Go, Rust, Python, C++ (Manual Memory Management/Pointers).

Frameworks & Architecture: NestJS, Pub/Sub (Kafka/RabbitMQ), Redis, ORM(Prisma), GraphQL, gRPC, Monorepo (Turborepo, Nx), ESLint

DevOps & Cloud: GCP, AWS, Kubernetes(K8s), Helm, Terraform, Docker, GitHub Actions, Jenkins, Cloudflare, Proxmox

Databases: SQL (MySQL, SQL Server), NoSQL (MongoDB, Elasticsearch)

Security & Identity: WireShark, Burp Suite, Kali Linux, NMap, SSL/TLS, Sysinternals, VPN(WireGuard/OpenVpn), SAML 2.0 (SP/IdP-Init), OAuth2, OIDC, JWT, WAF

WORK EXPERIENCE

Reflectiz ([Site](#) | [raises \\$22 million](#))

Jul 2023 – Present

Senior Security Backend Developer

Ramat Gan, Israel

- Engineered a proprietary web scanning engine that actively probes and deconstructs complex web applications to expose hidden security risks and supply-chain vulnerabilities.
- Architected secure, high-throughput backend services (Node.js/TypeScript) powering large-scale automated analysis, capable of operating under extreme load and adversarial conditions.
- Developed sophisticated JavaScript injection mechanisms to mock browser APIs and intercept network calls, enabling real-time monitoring of malicious execution within the DOM.
- Hacked Chromium-based browser internals using Puppeteer and custom debugging tools to extend low-level components, allowing for deep-DOM analysis that traditional security solutions miss.
- Engineered an automated pipeline to feed internal AI models with captured scripts, enabling real-time JavaScript deobfuscation and exposing malicious logic hidden behind complex packing and anti-debugging techniques.
- Collaborated with security researchers to translate "attacker-mindset" discoveries into robust, production-grade defenses and automated detection logic.

Oversight (SenseApps) ([Site](#))

Mar 2021 – Jun 2023

Full Stack Developer

Petah Tikva, Israel

- Developed an e-commerce management web application targeted at shop owners providing detailed and comprehensive tools such as full dashboard analytics, and a configurable WhatsApp chatbot using Node.js (Nest.js) and React.js.
- Containerized services for automated deployment using Docker and integrated Jenkins, resulting in a 30% improvement in software reliability and faster deployment while enabling a scalable host architecture.
- Spearheaded the development of a new codebase architecture, implementing best practices around variable and function naming, DRY principle and comments, reducing employee onboarding time, and improving overall code readability.
- Directed team-wide unit testing for the frontend and backend, increasing code coverage and confidence in code changes, leading to a 25% decrease in regression bugs and reduced time spent on manual testing.
- Led an effort to rewrite the codebase with an opinionated framework, NestJS, increasing development velocity across multiple departments and system maintenance through a modular architecture with lightweight microservices.
- Implemented Kafka as an internal messaging system, boosting data handling and communication efficiency, resulting in a 30% improved processing speed and increased customer satisfaction.

Checkpoint ([Site](#))

Jul 2020 – Mar 2021

Automation Developer

Tel Aviv, Israel

- Developed a C++ program to detect failures in industrial machinery before errors occurred, such as software compatibility issues from OS updates, reducing technical assistance, and improving equipment availability for employees by 15%.
- Facilitated the maintenance of high-quality standards for automation tools and software through Azure Event Hubs and Log Analytics for bug detection in adherence to best practices, resulting in a 40% reduction in code issues.
- Constructed team goals through requirements gathering, short-term and long-term planning, project management, and mentorship in collaboration with others, resulting in a more cohesive and productive team environment.

PROJECTS

My Portfolio ([GitHub](#) | [Site](#))

Self-Hosted Home Media Cloud (Proxmox & NAS) ([Jellyfin Website Username and Password: test](#))

- Engineered a private homelab server using Proxmox (VE) to manage multiple LXC containers and VMs, providing a secure, private cloud for family use.
- Implemented Nginx Reverse Proxy with SSL (Let's Encrypt) and Cloudflare integration for secure external access, managed via automated deployment scripts.
- Configured hardware-accelerated transcoding to handle real-time video conversion across various client devices, optimizing bandwidth and CPU/GPU usage. You can force server-side transcoding by changing the resolution.

I resolved a popular bug in World of Warcraft, where the game would take 10 minutes to launch ([forum post](#))

EDUCATION

"Clean Code" by Robert C. Martin (Self-Study)

Magshimim

National Cyber Program

Nov 2015 – Nov 2018

Bat Yam, Israel
